Ex. No.:5	AUTOMATED LEGAL DOCUMENT ANALYZER USING GPT-4	URK23CS1019
30-10-2026		

Aim:

To develop an automated legal document analyzer using GPT-4 that summarizes legal documents and extracts important information such as parties, key clauses, obligations, payment terms, termination conditions and important dates.

Problem Statement:

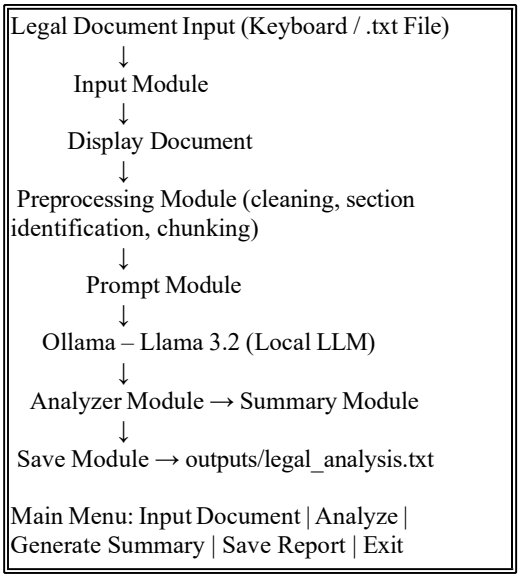

Design and develop an automated legal document analyzer using GPT-4. The application should accept legal contracts or legal text, analyze the content, generate a concise summary, identify important clauses and obligations, extract relevant information and present the results in a structured format.

Software Requirements:

Software	Version
Python	3.x
Ollama	Local LLM runtime
VS Code	Code editor
Requests	HTTP communication with Ollama API

Input Parameters

Parameter	Description
Legal Document	Contract or legal text entered through keyboard or loaded from a .txt file
Document Type	Identified from the supplied document content
Parties	Names of parties mentioned in the document
Document Length	Character, word and line counts
Analysis Type	Structured analysis covering summary, clauses and obligations
Output Format	Structured text report saved as outputs/legal_analysis.txt

System Architecture

The system architecture is represented in the flow diagram above.

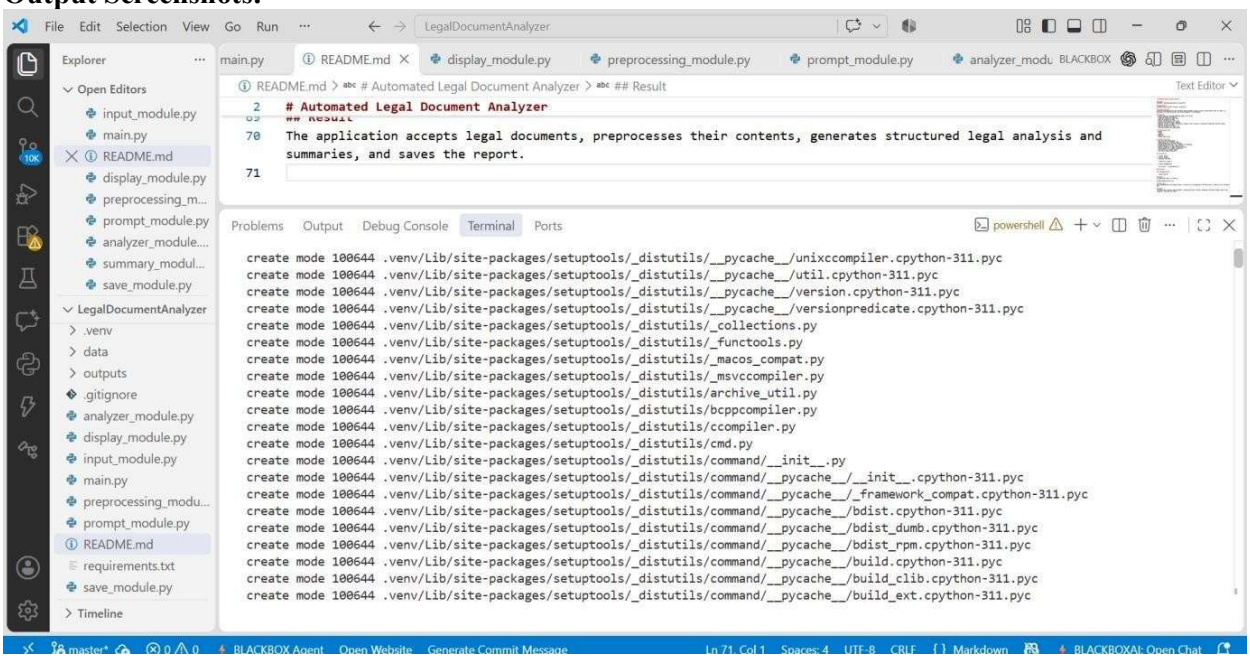

Module Design

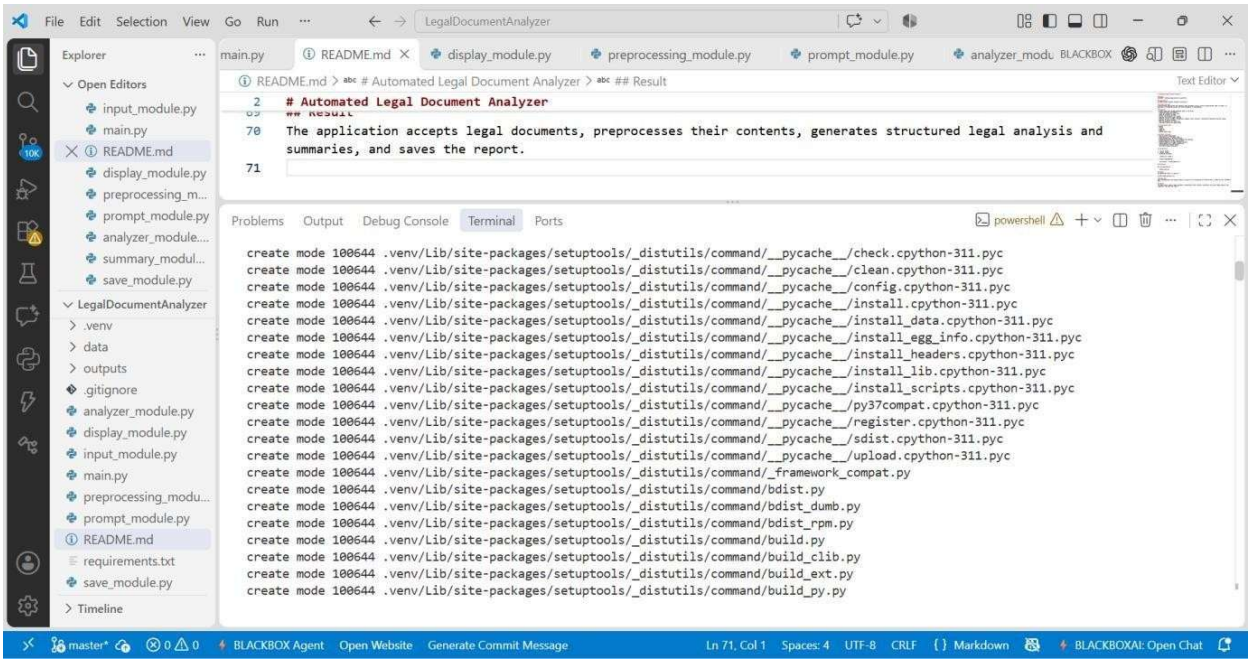

Module	Responsibility
Input Module	Accepts legal text through keyboard input or loads a .txt file.
Extraction Module	Reads the text content from the selected .txt file; PDF extraction is not implemented.
Preprocessing Module	Removes extra spaces, normalizes text, identifies section headings and splits long text into chunks.
Prompt Module	Builds instructions for structured legal analysis and tells the model not to invent missing information.
Analyzer Module	Sends the prompt to the local Ollama Llama 3.2 model and displays the generated analysis.
Summary Module	Generates a concise summary of the legal document using the language model.
Save Module	Saves the document, analysis, summary and disclaimer to outputs/legal_analysis.txt.
Display Module	Displays document content and basic document statistics.
Utility Module	Provides shared Ollama API and helper functions.

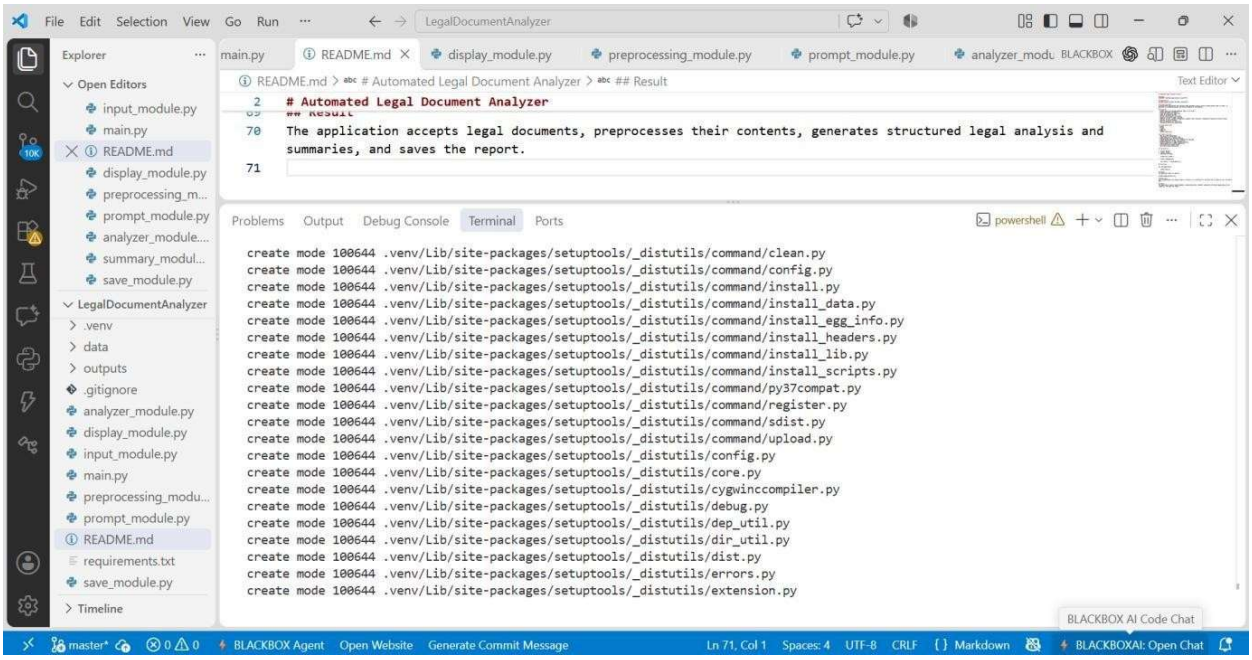

Implementation
GitHub Link : https://github.com/dicksonS19/gpt4.git LinkedIn Post Link: https://www.linkedin.com/in/dickson s?utm_source=share_via&utm_content=profile&utm_medium=member_ios

Implementation Note: The application uses Python with the locally running Ollama Llama 3.2 model instead of calling the GPT-4 API. It accepts keyboard input and .txt files. PDF text extraction is not implemented in this version.

Output Screenshots:

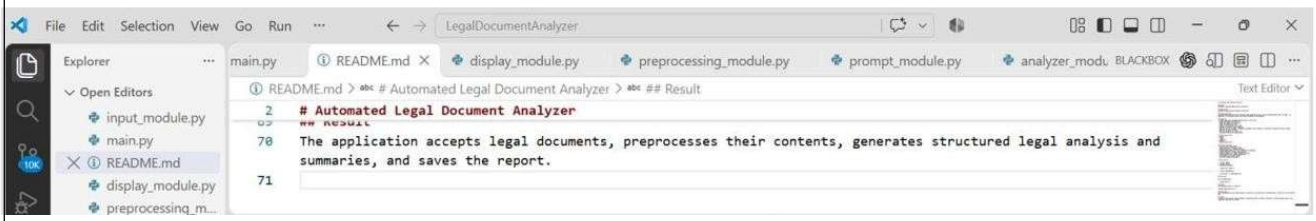

```
============================================================
       AUTOMATED LEGAL DOCUMENT ANALYZER
============================================================
1. Upload / Enter Legal Document
2. Analyze Document
3. Generate Summary
4. Save Report
5. Exit

Enter your choice: 1

===== LEGAL DOCUMENT INPUT =====
1. Enter legal text manually
2. Read legal document from TXT file
Choose an option: 1

Enter your legal document.
Type END on a separate line when finished.
```

```
============================================================
            LEGAL DOCUMENT INFORMATION
============================================================

Document Content:

SERVICE AGREEMENT

This agreement is between ABC Technologies and XYZ Solutions.

The agreement is valid for 12 months.

ABC Technologies will provide software development services.

XYZ Solutions will pay Rs. 50,000 per month.

Both parties must maintain confidentiality.

Either party may terminate the agreement by giving 30 days written notice.
```

Result:

Thus, the Automated Legal Document Analyzer was successfully developed using Python and the local Ollama Llama 3.2 model. The application accepts legal text through keyboard input or a .txt file, preprocesses and chunks the content, generates a structured analysis of the document, identifies parties, obligations, payment terms, duration, termination conditions, important dates and key clauses, creates a concise summary, and saves the report to outputs/legal_analysis.txt. The implementation uses a local LLM rather than the GPT-4 API.
